

Confirmation of low-voltage cabling cable trays

Overview

A Guide To Cable Support Systems Running data communications cable through any building requires planning.

Key Takeaways

Low-voltage cabling in cable trays must comply with NEC standards, maintain proper separation from high-power cables, adhere to fill limits, and ensure grounding for safety and performance.

Cable Types: Only use cables rated for tray installation, such as Tray Rated (Type TC) or Metal-Clad (Type MC) cables. Low-voltage signal, control, and communication cables should be clearly identified and suitable for open-air tray environments (NEC Article 392) . **Separation from High-Power Cables:** Low-voltage cables must be separated from high-power circuits to prevent electromagnetic interference (EMI). If mixed in the same tray, a solid divider wall is required. Cables with different voltage ratings can share a tray only if all circuits operate at the same voltage, typically 600 volts or less . **Tray Fill Limits:** Maintain proper fill percentages to avoid overheating and mechanical stress. For control and low-voltage cables, the fill should not exceed 50% of the tray's cross-sectional area. Power cables are limited to 40% fill . **Grounding and Bonding:** Metallic cable trays must be grounded according to NEC Article 250.96. Even if the tray is not used as an equipment grounding conductor (EGC), grounding prevents electrical shocks and equipment malfunctions. A separate EGC conductor (minimum #4 AWG) can be installed inside or attached to the tray . **Mechanical Considerations:** Cables must be secured to prevent sagging or movement. Vertical tray installations are acceptable, and fill requirements are the same as horizontal trays. Tie wraps or fasteners should be inspected periodically, especially for single-conductor cables . **Environmental and Material Selection:** Choose tray materials (aluminum, steel, FRP) based on environmental conditions, load requirements, and corrosion resistance. Ventilated or solid-bottom trays can be used depending on heat generation and protection needs . **Fire and Safety Compliance:** Ensure firestop systems are installed at penetrations and that trays are accessible for maintenance. Avoid placing cable trays in hoistways or enclosed spaces .

Best Practices

- Use separate trays or dividers for low-voltage and high-power circuits to maintain signal integrity.
- Verify that all cables are rated for the intended voltage and environmental conditions.
- Regularly inspect trays for mechanical integrity, corrosion, and proper cable fastening.
- Document tray layouts and cable routing for maintenance and compliance verification. By following these guidelines, low-voltage cabling in cable trays can be safely installed, compliant with NEC standards, and protected against EMI, overheating, and mechanical failure .
