

Huawei Industrial Switch Debugging and Configuration

Overview

Huawei Switch Discovery Tool: This tool can be used to discover Huawei network switches on a network.

Key Takeaways

Huawei industrial switches can be configured and debugged via CLI using SSH or console access, with commands for interface management, VLAN setup, user access, and real-time debugging.

- Accessing the Switch
 - Connect via Console or SSH: Use a terminal emulator for console access or SSH/Telnet for remote management .
 - Login: Enter your username and password. For new users, create accounts with AAA commands and assign access levels (1-15) to control privileges .
 - Enter System View: Type system-view to access configuration mode.
- Basic Configuration
 - VLAN Setup: Create VLANs using vlan and assign ports with interface GigabitEthernet 0/0/x followed by port link-type access and port default vlan .
 - Interface Verification: Use display interface or display interface to check status and configuration .

- IP Configuration: Assign IP addresses to interfaces with ip address and verify with display ip interface brief .

User Access and Security

- Enable Telnet/SSH: Activate Telnet or SSH services for remote access using stelnet server enable or ssh server enable .

- User Authorization: Create users and grant access with local-user password irreversible-cipher and local-user privilege level .

- Save Configuration: Use save to make changes permanent.

Debugging and Monitoring

- Enable Debugging: Use terminal debugging to display debugging messages on the console or SSH session .

- Monitor Logs: Activate terminal monitor to view logs, traps, and debugging messages in real-time .

- Display Debugging Status: Use display debugging to see active debugging commands and undo debugging all to stop all debugging .

- Log Management: Configure log levels and buffer size with display logbuffer and specify log types (alarms, traffic, security) for detailed monitoring .

Best Practices

- Limit Debugging Scope: Avoid enabling broad debugging commands like debug ip packet without filters, as excessive debugging can overload the switch .

- Verify Configurations: Regularly use display running-config and display vlan to ensure correct setup .

- Exit Safely: Log out after configuration changes to prevent unauthorized access. By following these steps, administrators can effectively configure Huawei industrial switches, monitor system behavior, and troubleshoot network issues efficiently.
