

Irish Galvanized Cable Tray Standard

Overview

Codes and Standards | Cable Tray InstituteThe Cable Tray Institute is making available the current edition of this practical guide for the proper installat.

Key Takeaways

Galvanized cable trays in Ireland generally conform to BS EN 61537, specifying metallic construction, corrosion resistance, and electrical continuity requirements.

Applicable Standards

In Ireland, metallic cable trays, including galvanized types, are typically manufactured and installed in accordance with BS EN 61537: Cable management – cable tray systems and cable ladder systems . This standard covers:

- **Material and construction:** Steel is the primary material, with finishes including pre-galvanized mild steel, hot-dip galvanized steel, and stainless steel for enhanced corrosion resistance .
- **Corrosion resistance:** Galvanized trays are protected by a zinc coating, which provides sacrificial protection; the thickness of the zinc layer determines the level of corrosion resistance . Hot-dip galvanization offers a thicker, more durable coating compared to electro-galvanization .
- **Electrical continuity:** Metallic trays must maintain electrical conductivity across joints and fittings, ensuring safe grounding and bonding .

- Flame propagation: Components are classified as non-flame propagating to meet fire safety requirements .
 - Load and span ratings: BS EN 61537 specifies load/span classes to ensure trays can safely support cables over given distances .
 - Temperature limits: Minimum and maximum operating temperatures are defined for system components to ensure performance under environmental conditions .
- Galvanization Details
- Hot-dip galvanization: Steel trays are dipped in molten zinc, forming a protective layer that oxidizes slowly to create a zinc carbonate patina, enhancing corrosion resistance .
 - Electro-galvanization: Provides a thinner zinc layer, suitable for less corrosive environments, but less durable than hot-dip galvanization .
 - Maintenance: Any scratches or exposed steel areas develop a protective oxide layer over time, maintaining long-term durability .

Installation and Compliance

- Cable trays must be installed according to manufacturer specifications and BS EN 61537 guidelines, ensuring proper support, spacing, and secure connections .
- Accessories such as bends, tees, and brackets are designed to maintain structural integrity and electrical continuity .
- Compliance with European and Irish electrical codes ensures safety for power and control cable installations.

Summary

For galvanized cable trays in Ireland: BS EN 61537 is the primary standard, covering metallic construction, corrosion protection, electrical continuity, load ratings, and temperature limits. Hot-dip galvanization is preferred for high-corrosion environments, while pre-galvanized or electro-galvanized trays are suitable for standard indoor applications. Proper installation and adherence to manufacturer and standard guidelines ensure safety, durability, and regulatory compliance .
