

Primary distribution boxes require dual grounding

Overview

Instead, a single point of grounding is preferred for this type of system, creating a uni-grounded or single-point grounded system. It is recommended to ground the neutral at various strategic locations in distribution substations, overhead lines and underground cables, distribution transformers, and all. The NESC requires multigrounded distribution system neutrals to be effectively grounded (Rule 96C). The definition of effectively grounded is as follows: Effectively Grounded. The neutrals play an important role in power quality and safety problems. Grounding electrode conductors must be connected at. Power from factory ground must be installed by a qualified electrician. Each DISTRIBUTION BOX and controller must be grounded. Safety of Personnel: By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel. This helps to reduce the potential difference that exists between.
