

What are the different uses and classifications of optical port modules

Overview

Depending on encapsulation forms, optical modules are mainly classified into GBIC, SFP, SFP+, XFP, SFF, and CFP modules. These modules provide different types of optical ports, such as SC and LC. Among these optical modules, SFP, SFP+, and XFP modules are most commonly. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. As the demand for faster and more reliable internet and data services grows, understanding these devices becomes increasingly important.
