

What is a server that hosts AI

Overview

AI servers are high-performance computing systems designed to process complex artificial intelligence workloads, including large-scale model training and real-time inference. AI, or artificial intelligence, is changing the way organizations and businesses handle data by incorporating automation of complex calculations, introducing new advanced applications, and fulfilling computational demands like never before. Their capabilities go far beyond those of traditional servers: They are built to support workloads from training to deployment, and can manage massive (and continually growing) datasets, process. Unlike traditional servers designed for general-purpose computing tasks such as hosting websites or managing databases, AI servers are specialised systems engineered to handle the specific computational demands of AI workloads. An AI server's architecture is all about.
